Error Correction Coding: Mathematical Methods and Algorithms provides a comprehensive introduction to both the theoretical and practical aspects of error correction coding, with a presentation suitable for a wide variety of audiences, including graduate students in electrical engineering, mathematics, or computer science. The pedagogy is arranged so that the mathematical concepts are presented incrementally, fol-lowed immediately by applications to coding.

We can correct at most 1 error in the sent codeword. For example, we would decode 101 as 111 because 111 is the most probable codeword sent. However, the code can detect up to $n-1$ errors. The problem with this code is that it is too expensive - in order to correct one error, you must triple the message size. 1.1.

An error-correcting code is assigned to each class, where each code is a bit vector. Figure 9.16 show an example of 7-bit codewords assigned to classes C 1, C 2, C 3, and C 4. We train one classifier for each bit position. Therefore, in our example we train seven classifiers.

In computing, telecommunication, information theory, and coding theory, an error correction code, sometimes error correcting code, (ECC) is used for controlling errors in data over unreliable or noisy communication channels. The central idea is the sender encodes the message with redundant information in the form of an ECC.
