Introduction to Plant Tissue Culture

The first technique is tissue culture where clusters of undifferentiated plant cells are grown in culture, which allows them to be manipulated, and then induced to develop into whole plants. The other technique is transformation where

The concept behind indexing plants free of pests is closely allied to the concept of using tissue culture as a selection system. Plant tissues known to be free of the pathogen under consideration (viral, bacterial, or fungal) are physically selected as the explant for tissue culture.
