Ans. Probability may be defined as the study of random experiments. In any random experiment, there is always an uncertainty that a particular event will occur or not. In any random experiment, there is always an uncertainty that a particular event will occur or not.

One possibility is to pick at random a family, each family being chosen with equal probability, and talk about the expected value that you get, or the average value if you sample that way. In this particular example with probability $1/4$, you get a 1, with probability $1/4$, you get a 1 with probability $1/4$, you get a 1.

Lecture Notes on Probability Theory and Random Processes

In probability theory and related fields, a stochastic or random process is a mathematical object usually defined as a family of random variables. Many stochastic processes can be represented by time series. However, a stochastic process is by nature continuous while a time series is a set of observations indexed by integers.

Stochastic process - Wikipedia

A random process is nothing but a collection of indexed random variables defined over a probability space. The index is in most cases time, but in general can be anything. This way of viewing a random process is advantageous, since we can derive the properties of the random process in terms of the properties of the random variables.

This unit provides an introduction to some simple classes of discrete random processes. This includes the Bernoulli and Poisson processes that are used to model random arrivals and for which we characterize various associated random variables of interest and study several general properties. It also includes Markov chains, which describe dynamical systems that evolve probabilistically over a ...

In statistics, a simple random sample is a subset of individuals (a sample) chosen from a larger set (a population). Each individual is chosen randomly and entirely by chance, such that each individual has the same probability of being chosen at any stage during the sampling process, and each subset of k individuals has the same probability of being chosen for the sample as any other subset of ...
